

2T2-101.2

AKA: *March Type 2*

Pick-up Points:

Obverse

- Obverse "N" die gouge "pimple" under IN of motto (common to all 2T2-101 Ikes)
- Dies scratches (all NW to SE in orientation): a neck scratch, the lower part of "E" in WE, between "G" and "O" of GOD, and between the "N" and "T" of IN and TRUST. The neck scratch is most robust to die state, while the lower E and G\O scratches are also fairly robust to die state, but not as much as the neck scratch. These scratches are solid markers for the 2T2-101 obverse (and not present on the 2T2-102 Ikes)
- Very small spread DDO (seen in 1, and the first T in TRUST, N, G, R in the motto)
- "Baseball" cap (die chip) at the top of Ike's head, just below the "E". The appearance of this marker marks the end of early die state, and the beginning of the appearance of the reverse die crack (they are only found together in the 2T2-101.2). It appears that there were two small, nearly convergent die cracks on the top of the head - the area where these two cracks converged closest resulted in die

Reverse

- A very small spread DDR - seen in the AR, stars 13 and 12, and the "R" in AMERICA; easier to detect in early die state
- Has a die crack in "STATE"; the appearance of this marker coincides with the appearance of the "baseball cap" marker on the obverse and correlates with end of EDS / onset of MDS. It appears that the crack may originate at the TE interval and propagate west to the A, then T, then S, based on observation of the crack across die states.
- Type 2 earth
